

Getting Started with Hazelcast

Working With Map Data

Grant Little

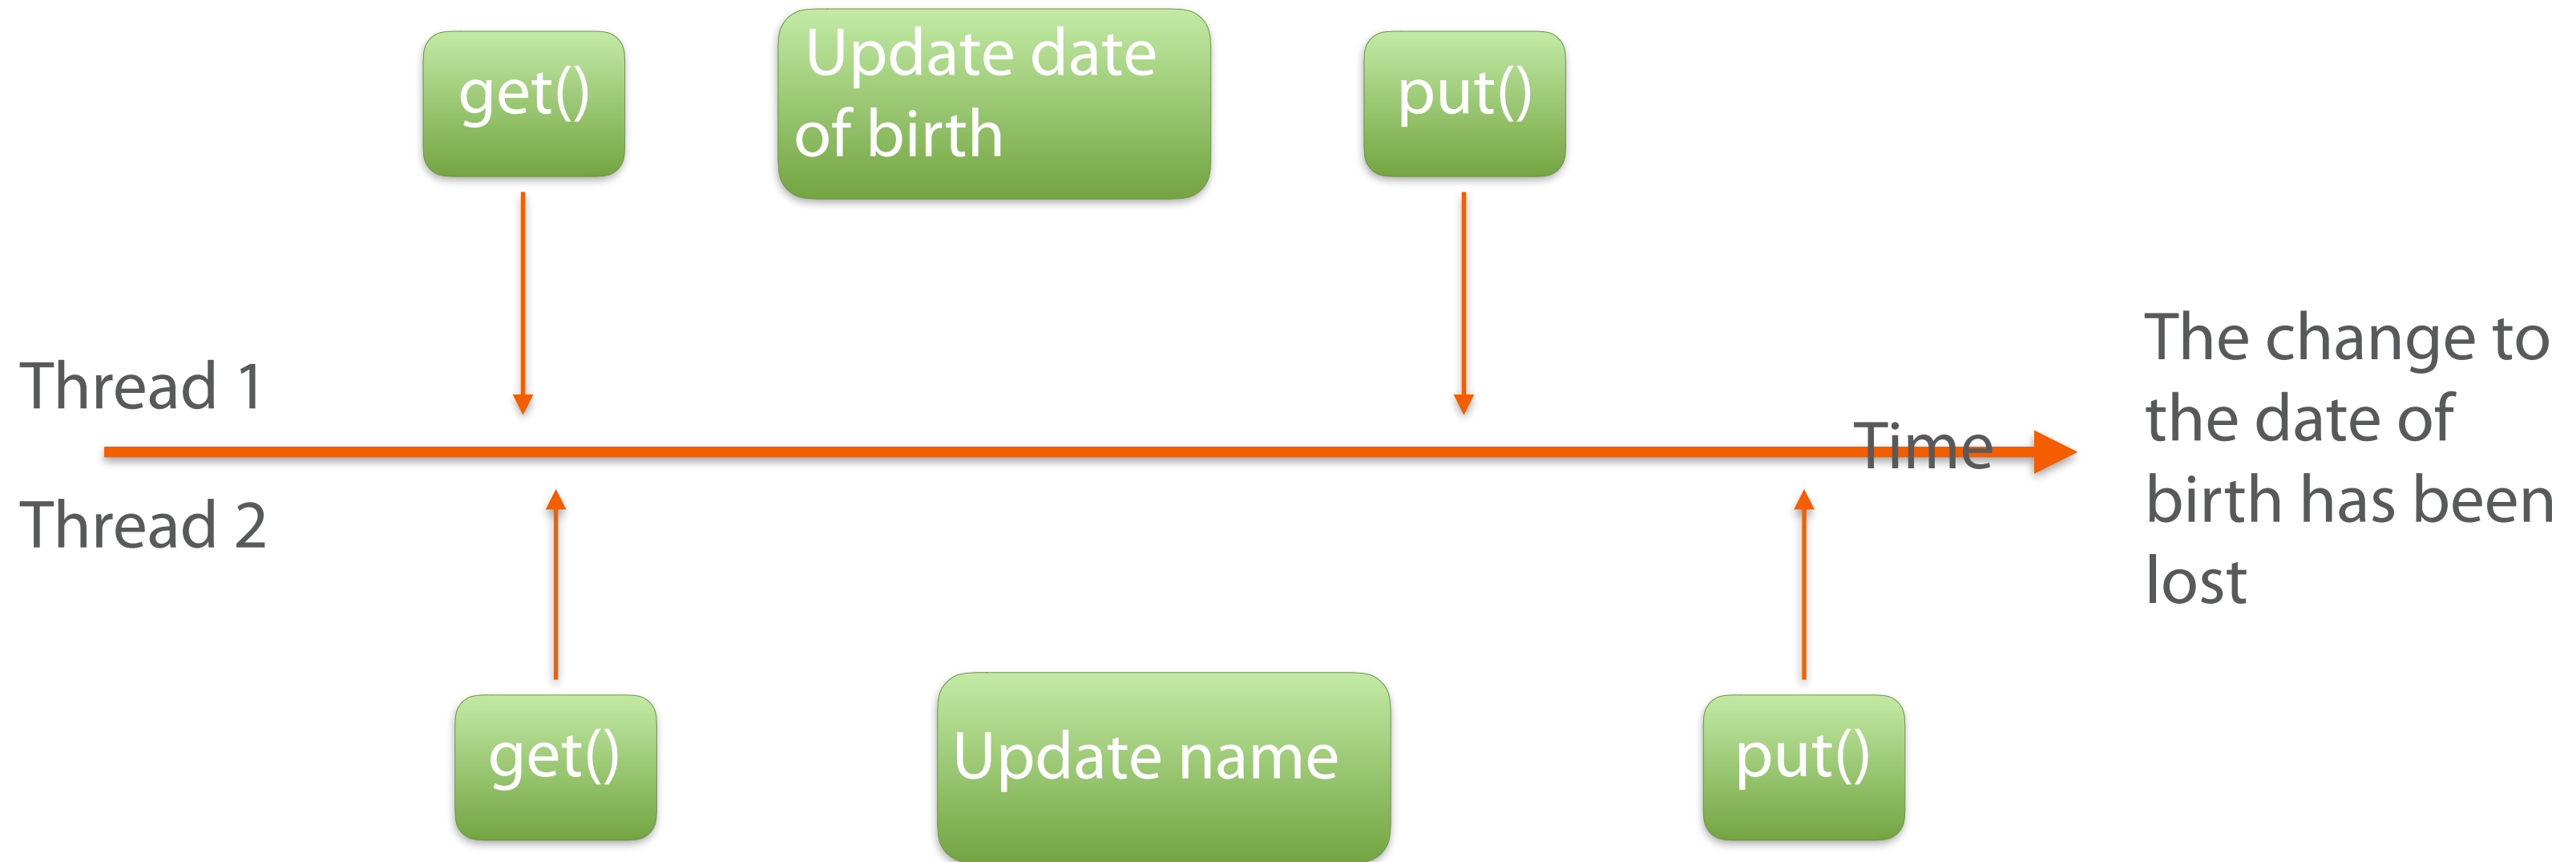

<http://www.grantlittle.me>

grant@grantlittle.me

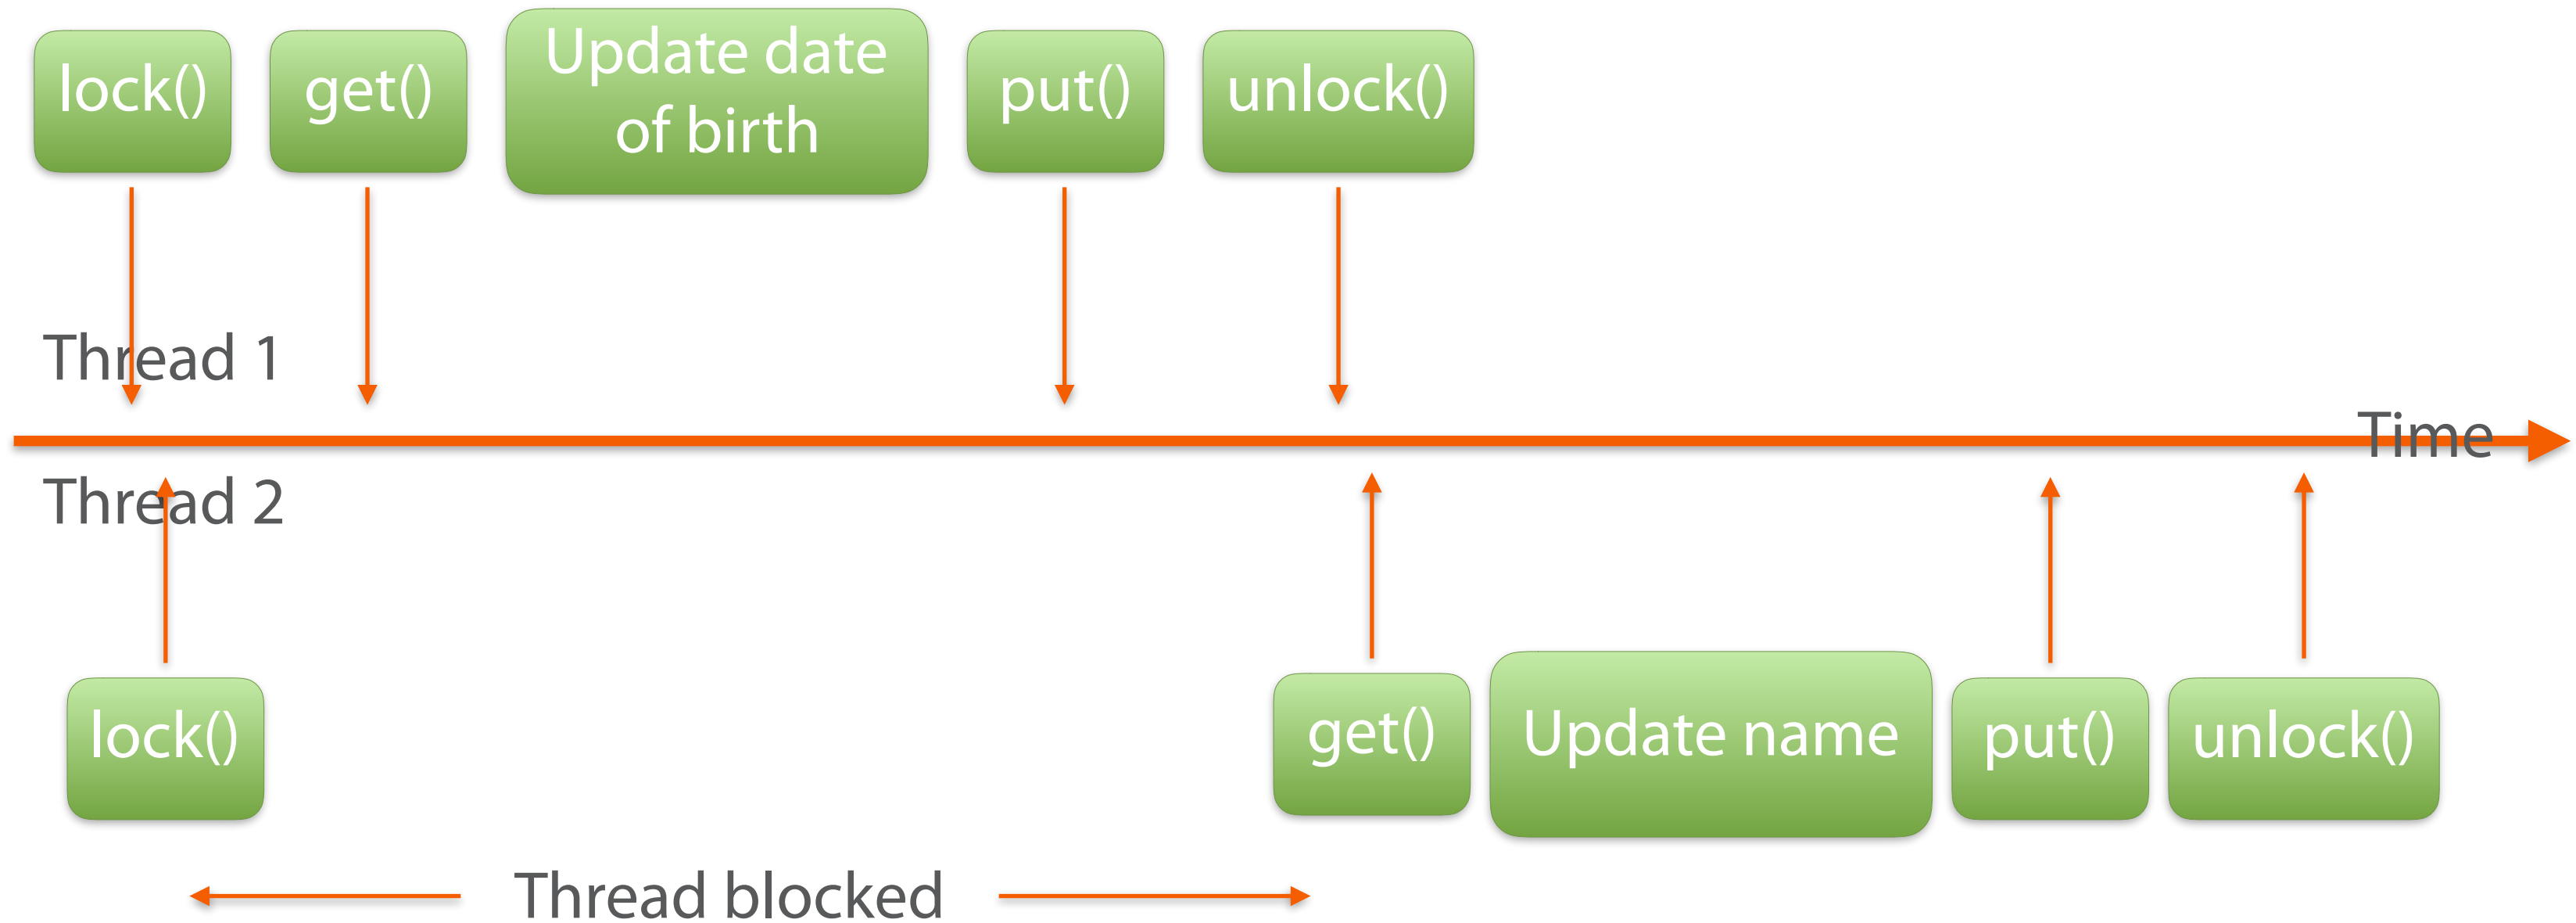

Overview

- Key level locks
- Avoiding locks - Entry Processors
- Retrieving aggregated data - Aggregators
- Keeping related data together - Data Affinity

Concurrency Issues

Why Key Locks?

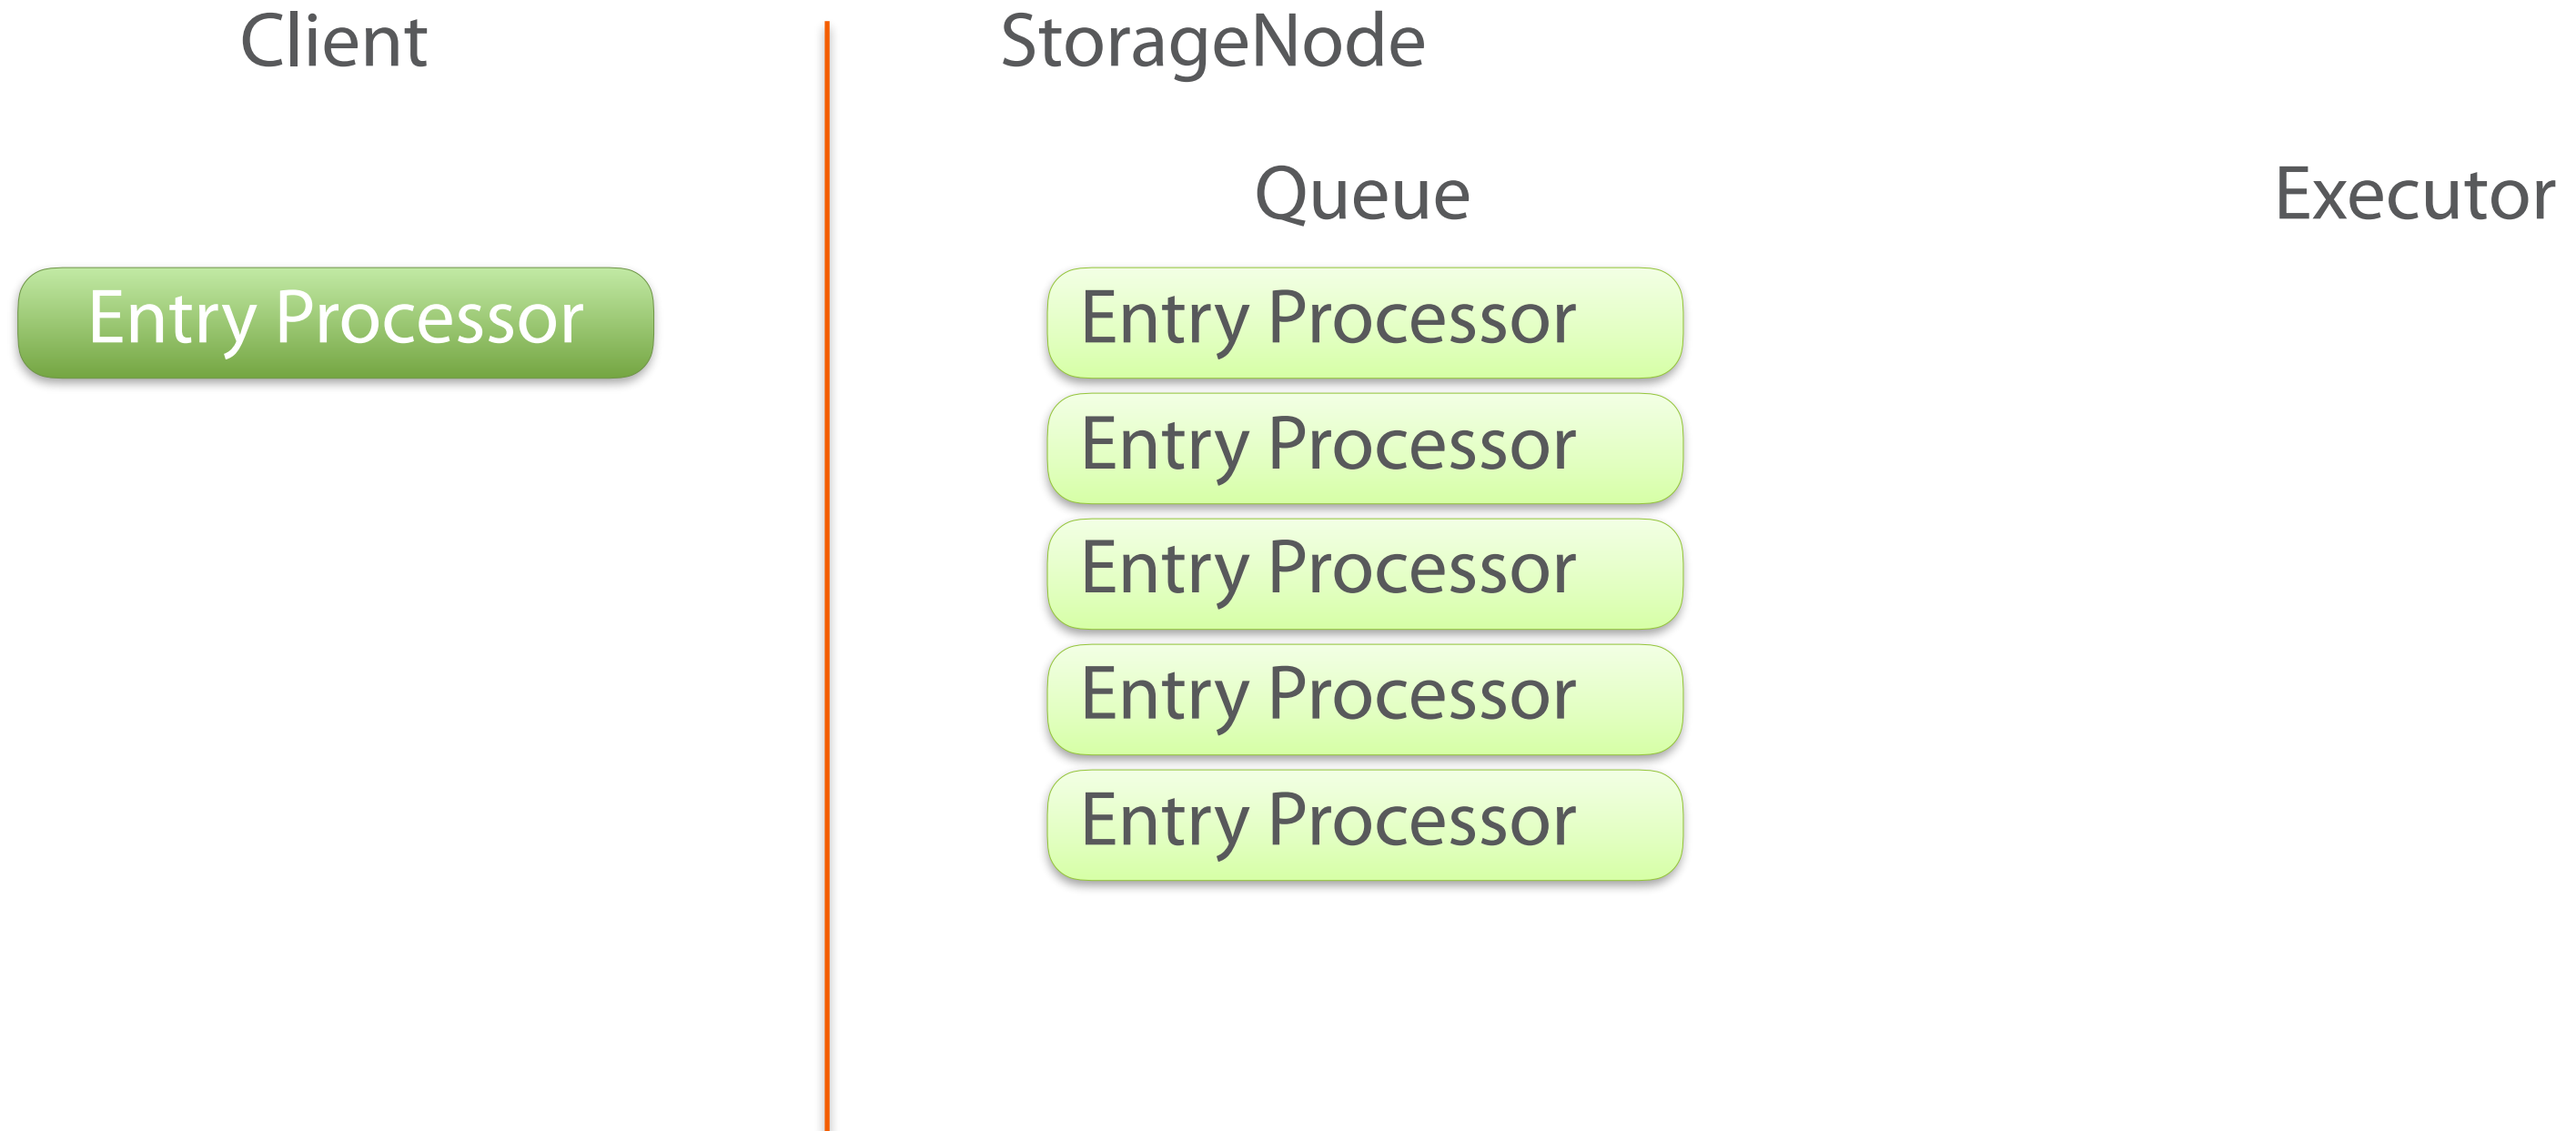

Problems with Locks?

- Create synchronisation points
 - Block other threads
- Data is pulled to the client, updated and pushed into map

Why Entry Processors?

- Data is updated directly on the storage node.
- Reduced serialised object size
- Avoid Synchronisation points in client code
- Thread safe
- Reduced complexity

Entry Processor Scheduling

Aggregators

Collect related items of data together for consumption

Sum Aggregator

<i>Date</i>	<i>Amount (\$)</i>
22/10/2015	45.99
22/10/2015	123.76
23/10/2015	87.42
24/10/2015	93.99
25/10/2015	12.89
25/10/2015	33.78
Total	397.83

Total Income

In the last 5 days

397.83

Sum Aggregator

<i>Date</i>	<i>Amount (\$)</i>
<i>21/10/2015</i>	<i>12.45</i>
<i>22/10/2015</i>	<i>123.76</i>
<i>25/10/2015</i>	<i>87.42</i>
<i>Total</i>	<i>223.63</i>

Storage Node 1

<i>Date</i>	<i>Amount (\$)</i>
<i>22/10/2015</i>	<i>97.54</i>
<i>22/10/2015</i>	<i>365.12</i>
<i>23/10/2015</i>	<i>23.82</i>
<i>Total</i>	<i>486.48</i>

Storage Node 2

<i>Date</i>	<i>Amount (\$)</i>
<i>21/10/2015</i>	<i>45.99</i>
<i>24/10/2015</i>	<i>67.99</i>
<i>24/10/2015</i>	<i>44.43</i>
<i>Total</i>	<i>158.41</i>

Storage Node 3

	<i>Amount (\$)</i>
<i>Storage Node 1</i>	<i>223.63</i>
<i>Storage Node 2</i>	<i>486.48</i>
<i>Storage Node 3</i>	<i>158.41</i>
<i>Aggregated Total</i>	<i>868.52</i>

Supplier Creation

- `com.hazelcast.mapreduce.aggregation.Supplier`
 - `Supplier.all()`
 - `Supplier.all(PropertyExtractor pe)`
 - `Supplier.fromPredicate(SqlPredicate predicate)`
 - `Supplier.fromPredicate(SqlPredicate predicate, Supplier chainedSupplier)`
 - `Supplier.fromKeyPredicate(SqlPredicate predicate)`
 - `Supplier.fromKeyPredicate(SqlPredicate predicate, Supplier chainedSupplier)`

Aggregation Creation

Average

Sum

Min

Max

Examples:

```
com.hazelcast.mapreduce.aggreation.Aggregation.integerAvg()  
com.hazelcast.mapreduce.aggreation.Aggregation.bigDecimalSum()  
com.hazelcast.mapreduce.aggreation.Aggregation.doubleMin()  
com.hazelcast.mapreduce.aggreation.Aggregation.bigIntegerMax()
```

Documentation

Out of the Box Aggregations:-

<http://docs.hazelcast.org/docs/3.5/javadoc/com/hazelcast/mapreduce/aggregation/Aggregations.html>

Create a Custom Aggregation:-

<http://docs.hazelcast.org/docs/3.5/javadoc/com/hazelcast/mapreduce/aggregation/Aggregation.html>

Suppliers:-

<http://docs.hazelcast.org/docs/3.5/javadoc/com/hazelcast/mapreduce/aggregation/Supplier.html>

Distributed Data

	Partition 1	Partition 2	Partition 3
Customers Map	Customer 1		
Transactions Map	Customer 1 Transaction 1	Customer 1 Transaction 2	Customer 1 Transaction 3

Data Affinity Example

- Customer has many addresses
 - Home
 - Work
- Use a single entry processor to retrieve customer and all their possible addresses

Module Review

- Concurrency and key level locking
- Use EntryProcessors to avoid concurrency issues
- Retrieving aggregated data
- Data Affinity - how to keep related data together for performance
